		10819129 2 (bases 1 to 83650) Sato,S., Nakamura,Y., Kaneko,T., Kato,T., Asamizu,E. and Tabata,S. Direct Submission Submitted (01-FEB-1999) Yasukazu Nakamura, Kazusa DNA Research Institute, Department of Plant Gene Research, 1532-3, Yana, Kisarazu, Chiba 292-0812, Japan (E-mail:ynakamu@kazusa.or.jp,	Tel:81-438-52-3935, Fax:81-438-52-3934) Address for correspondence: kaos@kazusa.or.jp For the latest information on annotation of this clone, please see http://www.kazusa.or.jp/kaos/cgi-bin/agd_graph.cgi?c=MPE11 Genes with similarity to proteins in the databases are described in 'product' or 'note' qualifiers. Genes that have no significant protein similarity are described as 'unknown protein'. The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://compbio.ornl.gov/crail-1.3/), GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html), NetGene2 (S.M. Hebsgaard, et al., CBS, Technical University of Denmark, http://www.cbs.dtu.dk/services/NetGene2/) and SplicePredictor (Volker Brendel, Stanford University, http://gremlinl.zool.iastate.edu/cgi-bin/sp.cgi). Genes encoding tRNAs are predicted by tRNAscan-SE

Por the latest information on annotation of this clone, please see

http://www.kazusa.or.jp/kaog/cgi-bin/agd_graph.cgi?c=K4AA17

Genes with similarity to proteins in the databases are described in

'product' or 'note' qualifiers. Genes that have no significant

protein similarity are described as 'unknown protein'.

The software programs used to predict genes include: Grail

(Informatics Group, Oak Ridge National Laboratory,

http://compbio.ornl.gov/Grail-1.3/),

GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),

NetGenez (S.M. Hebsgaard, et al., CBS, Technical University of

SplicePredictor (Volker Brendel, Stanford University,

http://gremlinl.zool.idatate.edu/cgi-bin/sp.cgi).

Genes encoding tRNAs are predicted by tRNAscan-SE

(Sean Eddy, Washington University School of Medicine, St. Louis,

http://genome.wustl.edu/eddy/tRNAscan-SE/).

http://www.kazusa.or.jp/kaos/cgi.bin/agd_graph.cgi?c=MXIIO
Genes with similarity to proteins in the databases are described in
'product' or 'note' quallifiers. Genes that have no significant
protein similarity are described as 'unknown protein'.
The software programs used to predict genes include: Grail
(Informatics Group, Oak Ridge National Laboratory,
http://comppio.ornl.gov/Grail.1.3/),
GENSCAN (Chris Burge, MIT, http://CCR-081.mit.edu/GENSCAN.html),
NetGenez (S.M. Hebsgaard, et al., CBS, Technical University of
Denmark, http://www.cbs.dtu.dk/services/NetGenez/) and
SplicePredictor (Volker Brendel, Stanford University,
Http://grenlini.zool.lastate.edu/cgi.bin/sp.cgi)
Genes encoding tRNAs are predicted by tRNAscan-SE/)
This sequence may not be the entire insert of this clone. It may be shorter because we remove overlaps between neighboring submissions.
The 5' clone is MSIT and the 3' clone is MBBIB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /tränslation="MTEKIATDVSNMLNNYSPSRDFDGLIGMDAHMKEMESLLCLDSD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CDS
                                                                                                                                                                                 Genes were identified by a combination of several methods: Gene prediction programs including Genscan+ (Chris Burge, http://CCR-081.mit.edu/GensCAN.html), GeneMarkHMM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Mihaela Pertea, htm/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org/softlab/glimmerm.html/salzberg, contact mpertea@tigr.org), searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes with similarity to other proteins are named after the database hits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /clone="FSM4"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as thypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /gene="FISM4.1"

```
Genes were identified by a combination of several methods: Gene prediction programs including Geneca+ (Chris Burge, http://CCR-081.mit.edu/GENSCAN.html), GeneMarkHWM (Mark Borodovsky, http://genemark.biology.gatech.edu/GeneMark/), GlimmerA (a variant of GlimmerM, see Mihaela Pertea, http://www.tigr.org/softlab/glimmerm.html/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org/softlab/glimmerm.html/glimmerm.html, and GeneSplicer (Mihaela Pertea and Steven Salzberg, contact mpertea@tigr.org). searches of the complete sequence against a peptide database and the plant EST database at TIGR (http://www.tigr.org/tdb/tgi.shtml). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as unknown proteins. Genes without protein or EST similarity. Hup://genome.worm.genes.com/RNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE) (San Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE) (San Eddy, http://genome.washington.edu/RM/RepeatMasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /codon_start=1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     http://www.cbs.dtu.dk/netgoene/cbsnetgoene.html). Alternate exons not used in building the gene models are presented on the web pages associated with F9H3. Genes are numbered according to the scheme BAC.gene_number. Typically, these numbers progress from 1 upwards as one moves from position 1 of the BAC. Protein sequences ecoded by the genes are assigned to a functional category with the aid of similarity searches and comparison to the Prosite (http://expasy.hcuge.ch/sprot/prosite.html) and pfam (http://pfam.wustl.edu/) libraries. A description of these categories can be found at http://arabi/. Genomic repeats are thtp://murijac.mips.biochem.mpg.de/arabi/. Genomic repeats are typically located by TBLASTX analysis and an attempt is made to classify the function of each repeat as either transposon, putative microsatellite, LINE, direct repeat, centromeric repeat, etc.
               Submitted (06-MAY-1999) Lita Annenberg Hazen Genome Sequencing

Harbor, NY 11724
                                                                                                                                         Arabidopsis thaliana BAC F9H3 from chromosome IV near 18.8 cM BAC F9H3 is assigned between YACs CIC4A7 and CIC8B1 and maps to near 18.8 cM on the Lister & Dean R1 map. Position 1 of F9H3 is oriented toward the centromere and position 95519 is oriented toward the centromere and position 95519 is oriented toward the telomere. For more information on the mapping, sequencing and annotation of F9H3, please see http://www.cshl.org/arabweb/F9H3-titlepage.html. A graphic view of our annotation is also available at this url. Gene models are built (http://cor.081.mit.edu/GENSCAN.html), MZEF (http://compbio.ornl.gov/tools/index.shtml) and with splice sites predicted by NetPlantGene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        If you have any questions or confirmatory or contradictory evidence concerning the annotation of F9H3, please direct email to Larry Parnell at parnell@cshl.org.

BAC F9H3 was sequenced as part of the arabidopsis genome sequencing effort of the Cold Spring Harbor Consortium. For additional information, please see http://www.cshl.org/arabweb. Fingerprint data indicate F9H3 overlaps with F4C21 toward the telomere and with T5L23 toward the centromere. F9H3 contains marker mi233 at 18.8 cm on the Lister & Dean RI map.

Arabidopsis thaliana BAC TG123 from chromosome IV near 19 cm

On Feb 22, 1999 this sequence version replaced gi:3241935.

RATALISM maps to near 19 cm on the Lister & Dean RI map and is assigned to YAC CICBB1. Postition 1 of T5L23 is oriented toward the centromere. For more information on the mapping, sequencing and annotation of T5L23, please see http://www.cshl.org/arabweb/T5L23-titlepage.html.

A graphic view of our annotation is also available at this url.

Gene models are built with exons predicted by GenScan (http://compbio.ornl.gov/tools/index.shtml) and with splice sites predicted by NetPlantGene

(http://www.cbs.dtu.dk/netpgene/cbsnetpgene.html). Genes are numbered according to the scheme BAC.gene_number. Typically, these numbered according to the scheme BAC.gene_number. Typically, these numbered according to the scheme BAC.gene_number. Typically, these functional category with the aid of similarity searches and comparison to the Prosite.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          http://muntjac.mips.biochem.mpg.de/arabi/. Genomic repeats are typically located by TBLASTX analysis and an attempt is made to classify the function of each repeat as either transposon, putative microsatellite, LINE, direct repeat, centromeric repeat, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                If you have any questions or confirmatory or contradictory evidence concerning the annotation of T5L23, please direct email to Larry Parnell at parnell@cshl.org.

- Gardin for correspondence: atab@sequence.stanford.edu
Genes with similarity to proteins in the databases are described as 'putative', '-like' or 'similar to'. Genes that have BST similarity but no significant protein similarity are described as 'unknown proteins'. Genes that are annotated based only on gene prediction software are described as 'hypothetical proteins'.

The software programs used to predict genes include: Grail (Informatics Group, Oak Ridge National Laboratory, http://gnomic.stanford.edu/-chris/GENSCANW.html), GENSCAN (Ghris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), Fexa (V.Solovyev & A.Salamov, Sanger Centre, http://genomic.sanger.ac.uk/), NetplandGene (S.M. Hebbsgaard, et al., CBS, Technical University of Bonmark, http://www.cbs.dtu.dk/NetplantGene.html) and eMotifiNevill-Manning, C.G. Wu, T.D. & Brutlag, D.L., http://gnowic.ac.uk/).
                                                                                                                                                                Arabidopsis thaliana (thate tress).

                                                                                        (http://www.ches.du.dk/netpgene/cbsnetpgene.html). Genes are numbered according to the scheme BAC.gene_number. Typically, these numbered according to the scheme BAC.gene_number. Typically, these numbers progress from lupwards as one moves from position of the BAC. Hypothetical proteins are those having no EST matches and similarity only to other hypothetical proteins; predicted proteins have EST matches but cannot be assigned a function based on current composition and nomenclature within the nr protein database. Protein sequences encoded by the genes are assigned to a functional category with the aid of similarity searches and comparison to the Prosite (http://expasy.hcuge.ch/sprot/prosite.html) and Pfam (http://pfam.wustl.edu/) libraries. A description of these categories can be found at http://muntjac.mips.biochem.mpg.de/arabi/. Genomic repeats are typically located by TBLASTX analysis and an attempt is made to classify the function of each repeat, centromeric repeat, etc.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlapp as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (19-MAR-2003) Wellcome Trust Sanger Institute, Hinxton, Cambridgeshire, CB10 1SA, UK.
